

Preliminary Validation: 5-Episode Success Does Not Reliably Rank Checkpoints

What the scatter shows

- Five episodes quantize success into 20-point steps.
- Current rank agreement with the 200-episode result is weak.
- The same quick score can map to very different full-eval performance.

Concrete failure modes

False negative

Quick 0% vs. full 27.5%\nours_112_seed42_corner @ 010000

Overestimation

Quick 60% vs. full 14.5%\nsubzerocore_112_seed42_corner @ 002000

Preliminary finding: Raw 5-episode task success is too sparse and state-dependent to serve as a reliable checkpoint ranking signal.
